30051CIP1 11/19/04

PATENT

## Claim Amendments:

- 1. (Newly amended) An electrical probe comprising:
  - a conductive sleeve defining a bore;
  - a probe pin received in the bore;
  - the probe pin having a metal free end contact tip extending in a first direction;
  - the probe pin being biased in the first direction; and
  - the probe pin including an electrical component <u>serially intervening</u> between the free end <u>contact tip and an opposed end of the pin.</u>
- (Original) The probe of claim 1 wherein the electrical component includes a resistor having substantially greater resistance than the pin.
- 3. (Original) The probe of claim 2 wherein the electrical component includes a capacitor in parallel with the resistor.
- 4. (Original) The probe of claim 1 wherein the electrical component includes a capacitor.
- 5. (Original) The probe of claim 1 wherein the pin has a first conductive portion received within the sleeve, a second conductive portion including the tip, and wherein the electrical component is connected between the first and second portions.
- 6. (Original) The probe of claim 5 wherein the first and second portions are electrically isolated except for connection by the electrical component.
- 7. (Original) The probe of claim 5 wherein the first and second portions each have a flange, the flanges being spaced apart and connected to the electrical component.
- (Original) The probe of claim 7 including a cylindrical sleeve encompassing the flanges and the electrical component.
- (Original) The probe of claim 5 wherein the second portion has a length less than double its diameter.

30051CIP1 11/19/04

PATENT

- 10. (Original) The probe of claim 5 wherein the second portion has a length less than 0.50 inch.
- 11. (Newly amended) An electrical connector comprising:
  - a body;
  - a plurality of probes connected to the body;
  - each probe having a spring biased pin with a metal contact tip; and
  - each pin including an electrical component proximate to the tip and serially intervening between the tip and an opposed end of the pin.
- 12. (Original) The connector of claim 11 wherein the body is a circuit board having a periphery, and wherein each of the tips extends beyond the periphery.
- 13. (Original) The connector of claim 11 wherein each electrical component includes a resistor and a capacitor arranged in parallel.
- 14. (Original) The connector of claim 11 wherein each pin is received in a sleeve mounted electrically connected to a conductor on the body, and wherein each pin axially reciprocates within the sleeve.
- 15. (Original) The connector of claim 14 wherein each pin has a first conductive portion received within the sleeve, a second conductive portion including the tip, and wherein the electrical component is connected between the first and second portions.
- 16. (Original) The connector of claim 14 wherein the first and second portions are electrically isolated except for connection by the electrical component.
- 17. (Original) The connector of claim 14 wherein the first and second portions each have a flange, the flanges being spaced apart and connected to the electrical component.
- 18. (Currently amended) The connector of claim 14 wherein the second component has a length of less than double its diameter.

30051CIP1 11/19/04

PATENT

- 19. (Original) The connector of claim 14 wherein the probes are arranged at a first pitch distance, and wherein the second portion has a length less than the first pitch distance.
- 20. (Original) The connector of claim 14 including a cable electrically connected to the body, such that each of a plurality of conductors of the cable is independently connected to each probe.
- 21 (New) An electrical probe comprising:

  a conductive sleeve defining a bore;

  a probe pin received in the bore;

  the probe pin having a free end contact tip extending in a first direction;

  the probe pin being biased in the first direction; and

  the probe pin including a capacitor.
- 22. (New) The probe of claim 21 wherein the probe pin includes a resistor having substantially greater resistance than the pin.
- 23. (New) The probe of claim 22 wherein the capacitor is connected in parallel with the resistor.
- 24. (New) The probe of claim 21 wherein the pin has a first conductive portion received within the sleeve, a second conductive portion including the tip, and wherein the electrical component is connected between the first and second portions.
- 25. (New) The probe of claim 24 wherein the first and second portions are electrically isolated except for connection by the electrical component.
- 26. (New) The probe of claim 24 wherein the first and second portions each have a flange, the flanges being spaced apart and connected to the electrical component.
- 27. (New) The probe of claim 26 including a cylindrical sleeve encompassing the flanges and the electrical component.

PATENT

- 28. (New) The probe of claim 24 wherein the second portion has a length less than double its diameter.
- 29. (New) The probe of claim 24 wherein the second portion has a length less than 0.50 inch.
